

AMBITEX[®]

the brand trusted by professionals

EVERYWHERE[™]

-
- DISPOSABLE GLOVES
- REUSABLE GLOVES
- PROTECTIVE APPAREL

The hand protection trusted by professionals everywhere.

Professionals like you have trusted the AMBITEX® name as a symbol of consistency and value for over 25 years. As one of the nation's leading brands of hand protection, AMBITEX® products are stocked by leading distributors and trusted by the most prominent end users across a variety of markets.

Protecting you and those you serve is a responsibility we take very seriously.

Uncompromising Quality

AMBITEX® products are manufactured in professional, ISO certified and third-party audited manufacturing facilities. All products are manufactured to meet or exceed applicable industry standards and regulatory requirements, including ASTM, CE and FDA.

Peace of Mind

AMBITEX® products are protected from tampering by a C-TPAT certified supply chain. The designation, bestowed by the U.S. Department of Homeland Security, ensures adequate security safeguards from raw material to delivery.

CHOOSING THE RIGHT GLOVE

Latex Allergy

Latex allergy results from proteins contained in natural rubber latex. Exposure to latex proteins is possible via skin contact or inhalation, with the latter most commonly occurring when donning powder, containing proteins which have leached to the cornstarch, becomes airborne when changing gloves.

Estimates suggest only about 2% of the population experiences latex allergy symptoms, but those regularly exposed are at the greatest risk for a reaction. Synthetic gloves, such as vinyl and nitrile, continue to gain popularity because they do not contain latex.

CHOOSING THE RIGHT GLOVE

Using gloves to handle ready-to-eat foods

Most states food codes limit, if not prohibit, bare hand contact with ready-to-eat foods. Disposable gloves are an effective means of satisfying regulatory requirements, provided the gloves are made of materials accepted under the Federal Food, Drug & Cosmetic Act (FFDCA; 21 CFR parts 170-199) and comply with all applicable local and state regulations for food contact.

Gloves should be changed before starting a new task and whenever they become ripped, torn or contaminated. Contamination can occur after using the bathroom, smoking, coughing, sneezing, handling money and in between preparing raw and cooked foods. Always wash hands thoroughly before donning (putting on) new gloves.

Learn gloves from the experts at www.GloveUniversity.com

CHOOSING THE RIGHT GLOVE

Glove Lining

Many unsupported gloves are available with optional cotton flocklining. Flocklining absorbs perspiration, provides added comfort and prevents the glove from slipping during use. Unlined gloves help to minimize the opportunity for product contamination, making them popular in food processing and other environments where the potential shedding of the cotton flock is a concern. They can also often be worn with a cotton glove liner underneath for optimal comfort.

CHOOSING THE RIGHT GLOVE

Cuff Styles

Beading delivers added strength to the cuff, making the glove more durable when being donned (put on). Straight cuffs are typically longer in length and can be folded over to protect the forearms from run-off.

Material

Resistance varies by material and chemical. Always consult a chemical resistance chart and test a glove's resistance to the hazards related to the task and work environment prior to making a glove selection.

CHOOSING THE RIGHT GLOVE

Cuff Styles

Knit wrist cuffs provide a snug fit and are ideal for keeping debris out.

Slip-on cuffs extend over wrist but offer a loose fit for faster/easier donning.

Glove Material

Cotton is naturally hypoallergenic, durable, breathable and soft. Polyester is resistant to shrinking, stretching, sunlight and mildew. When combined with cotton, the mix provides an extra measure of durability and strength. Nylon is a lightweight synthetic polymer providing a silk-like feeling and texture. It is resilient, easy to care for and resists fungi and mildew.

CHOOSING THE RIGHT GLOVE

Determining Cut Resistance & Performance

Material weight and construction influence cut and abrasion resistance.

Typically, materials like Kevlar® provide a high cut resistance due to the material weight. The addition of coatings such as nitrile, latex or polyurethane will often enhance grip and increase cut resistance.

Published performance ratings serve as a guide in choosing the best option for a particular application. EN 388 is a popular standard for assessing the performance of a glove and its ability to resist abrasions, cuts, tears and punctures. Each of the properties is individually tested and a performance level is awarded accordingly. The rating is expressed in a 4-digit performance level number which is often printed on the glove.
